WARRANTY

TEN YEAR LIMITED WARRANTY

GENERAL CONDITIONS

Damage to any part of this water conditioner because of misuse, misapplication, neglect, alteration, accident, installation or operation contrary to our printed instructions, or damage caused by any unusual force of nature such as, but not limited to, freezing, flood, hurricane, tornado, or earthquake is not covered by this warranty. In all such cases, regular parts and service charges will apply.

We assume no warranty liability in connection with this water conditioner other than specified herein. This warranty is in lieu of all other warranties, expressed or implied, including warranties of fitness for a particular purpose. We do not authorize any person or representative to assume for us any other obligations on the sale of this water conditioner.

Should a defect or malfunction occur, contact your contractor. If you are unable to contact your contractor, return the part, freight prepaid, directly to the factory at the address below. Enclose with the part a full description of the problem, with your name, full address, date purchased, model and serial numbers, and selling contractor's name and address. We will repair or replace the part and return it to you at no cost if our repair department determines it to be defective under the terms of the warranty.

This warranty gives you specific legal rights and you may have other rights which vary from state to state.

This water conditioner is manufactured by North Star Water conditioning, PO Box 64310, St. Paul, MN 55164-4310; customer information telephone no. 1-800-972-0135.

WARRANTY POLICY

North Star Water Conditioning, St. Paul, MN, warrants this water conditioner as stated herein:

From the date of installation, within the warranty period described below, we will repair or replace any part which we find defective because of faulty materials and workmanship, or corrosion. You pay only freight to our factory and local labor charges.

* ONE YEAR ON COMPLETE UNIT
* THREE YEARS ON ELECTRONIC CONTROL * THREE YEARS ON CONTROL VALVE BODY
* FIVE YEARS ON SALT STORAGE TANK * TEN YEARS ON MINERAL TANK, EXCLUDING MINERAL

SAFETY GUIDES

FOLLOW THE INSTALLATION INSTRUCTIONS CAREFULLY. FAILURE TO INSTALL THE SOFTENER PROPERLY voids the WARRANTY.

BEFORE YOU BEGIN INSTALLATION, READ THIS ENTIRE MANUAL. THEN, OBTAIN ALL THE MATERIALS AND TOOLS YOU WILL NEED TO MAKE THE INSTALLATION.

CHECK LOCAL PLUMBING AND ELECTRICAL CODES. THE INSTALLATION MUST CONFORM TO THEM. In Massachusetts, plumbing codes of Massachusetts shall be adhered to. Consult with your licensed plumber.

USE ONLY LEAD-FREE SOLDER AND FLUX FOR ALL SWEAT-SOLDER CONNECTIONS, AS REQUIRED BY STATE AND FEDERAL CODES.

USE CARE WHEN HANDLING THE SOFTENER. DO NOT TURN UPSIDE DOWN, DROP, OR SET ON SHARP PROTRUSIONS.

DO NOT LOCATE THE SOFTENER WHERE FREEZING TEMPERATURES OCCUR. DO NOT ATTEMPT TO TREAT WATER OVER 120°F. FREEZING, OR HOT WATER DAMAGE voids the WARRANTY.

AVOID INSTALLING IN DIRECT SUNLIGHT. EXCESSIVE SUN HEAT MAY CAUSE DISTORTION OR OTHER DAMAGE TO NON-METALLIC PARTS.

THE SOFTENER REQUIRES A MINIMUM WATER FLOW OF 3 GALLONS PER MINUTE AT THE INLET. MAXIMUM ALLOWABLE INLET WATER PRESSURE IS 125 PSI. IF DAYTIME PRESSURE IS OVER 80 PSI, NIGHTTIME PRESSURE MAY EXCEED THE MAXIMUM. USE A PRESSURE REDUCING VALVE IF NECESSARY. (ADDING A PRESSURE REDUCING VALVE MAY REDUCE THE FLOW.)

THE SOFTENER WORKS ON 24 VOLT-60 Hz ELECTRICAL POWER ONLY. BE SURE TO USE THE INCLUDED TRANSFORMER.
UNPACKING / INSPECTION

The softener is shipped in 1 master carton (cabinet NSC models), or 2 cartons (2 - tank NST models). The softeners are completely assembled at the factory, except as required at installation.

Be sure to check the entire softener for any shipping damage or parts loss. Also note damage to the shipping cartons. Contact the transportation company for all damage and loss claims. The manufacturer is not responsible for damages in transit.

Small parts, needed to install the softener, are on a skin - packed cardboard piece. To avoid loss of the small parts, keep them on the skin - pack until you are ready to use them.

BEFORE STARTING INSTALLATION

WHERE TO INSTALL THE SOFTENER

- Place the softener as close as possible to the pressure tank (well system) or water meter (city water).

- Place the softener as close as possible to a floor drain, or other acceptable drain point (laundry tub, sump, standpipe, etc.).

- Connect the softener to the main water supply pipe BEFORE or AHEAD OF the water heater. DO NOT RUN HOT WATER THROUGH THE SOFTENER. Temperature of water passing through the softener must be less than 120°F (49°C).

- Keep outside faucets on hard water to save soft water and salt.

- Do not install the softener in a place where it could freeze. Freeze damage is not covered by the warranty.

- Put the softener in a place water damage is least likely to occur if a leak develops. The manufacturer will not repair or pay for water damage.

- A 120 volt electric outlet, to plug the included transformer into, is needed within 10 feet of the softener. The softener has a 10 foot power cable. If the outlet is remote (up to 100 ft), use 18 gauge wire to connect. Be sure the electric outlet and transformer are in an inside location, to protect from wet weather.

- If installing in an outside location, you must take the steps necessary to assure the softener, installation plumbing, wiring, etc., are as well protected from the elements, contamination, vandalism, etc., as when installed indoors.

- Keep the softener out of direct sunlight. The sun’s heat will melt plastic parts.

TOOLS, PIPE and FITTINGS, OTHER MATERIALS YOU WILL NEED

- In and out pipes to the softener must be at least 3/4" size. Some local codes require a minimum of 1" pipe size. To plumb with 1" pipes, buy adaptors to fit the 1" pipe threads on the installation adaptors or bypass valve (see page 6). You should maintain the same, or larger, pipe size as the water supply pipe, up to the softener inlet and outlet.

- Use copper, brass, or galvanized pipe and fittings. Some codes may also allow CPVC plastic pipe.

- ALWAYS install a bypass valve or valves. Either use the optional valve (included with some models), or 3 shut-off valves. Bypass valves let you turn off water to the softener for repairs if needed, but still have water in the house pipes.

- Drain hose (3/8" or 7/16" inside diameter) is needed for valve and salt tank drains. You can buy good quality, thick-wall, flexible hose at most hardware stores.

- If a rigid valve drain is needed, to comply with plumbing codes, you can buy the parts needed (see page 8) to connect a 1/2 in. copper tubing drain.

- Nugget or pellet water softener salt is needed to fill the brine tank (see page 9 and 17).

PLAN HOW YOU WILL INSTALL THE SOFTENER

You must first decide how to run in and out pipes to the softener. Look at the house main water pipe at the point where you will connect the softener. Is the pipe soldered copper, glued plastic, or threaded galvanized? What is the pipe size?

Now look at the typical installation illustration on page 6. Use it as a guide when planning your particular installation. Be sure to direct raw, hard water to the softener valve inlet fitting. The valve is marked IN and OUT.
A... TO OPTIONAL (incl. with some models) BYPASS VALVE AT SOFTENER

B... TO INSTALLATION ADAPTORs (included) AT SOFTENER, USING 3-VALVE BYPASS

THREADS ON THE BYPASS VALVE ARE 1" MALE PIPE. IF 1" MALE PIPE IS NEEDED, USE 1" ADAPTORs AND PLUMB TO THE 1" THREADS.

* Included with softener

Note: Threads on the installation adaptors are 1" male pipe. If 1" pipes are needed, buy adaptors and plumb to the 1" threads.
INSTALLATION STEPS

1. INSTALL INLET-OUTLET ADAPTORs, OR BYPAss VALVE:

   ▶ Push the adaptors (lubricate o-ring seals) into the valve inlet and outlet ports...figure 1A.

   - OR -

   ▶ Push the bypass valve (lubricate o-ring seals) into both ports of the valve...figures 1A and 1B.

   ▶ Snap the 2 large plastic clips in place, from the top, down...figures 1A and 1B. Be sure they snap into place. Pull on the adaptors, or bypass valve, to make sure they hold securely in place.

2. INSTALL THE BRINE TANK OVERFLOW FITTINGS:

   ▶ Insert the rubber grommet into the 3/4" diameter hole in the brine tank sidewall...see page 8.

   ▶ Push the barbed end of the hose adaptor elbow into the grommet.

3. MOVE THE SOFTENER ASSEMBLY (CABINET MODELS), OR RESIN TANK (2 TANK) INTO INSTALLATION POSITION:

   ▶ Be sure the installation surface is level and smooth. If needed, place the tank on a section of 3/4" thick (min.) plywood. Then, place shims under the plywood as needed to level the softener.

4. PLUMB IN AND OUT PIPES TO AND FROM SOFTENER:

   CAUTIONS: Observe all of the following cautions as you connect inlet and outlets plumbing.

   ▶ Turn off the house water supply valve and open faucets to relieve pressure in the pipes.

   ▶ BE SURE RAW, HARD WATER IS DIRECTED TO THE VALVE INLET PORT.

   ▶ Be sure to use bypass valve(s).

   ▶ If making a soldered copper installation, do all sweat soldering before connecting pipes to the softener fittings. Torch heat will damage plastic parts.

   continued
INSTALLATION STEPS, continued

- Put grounding clamps (see step 8) on copper tubes before soldering.
- When turning threaded pipe fittings onto plastic fittings, use care not to cross-thread.
- Use pipe joint compound on all external pipe threads.
- Support inlet and outlet plumbing in some manner (use pipe hangers) to keep the weight off of the valve fittings.

5. CONNECT AND RUN THE VALVE DRAIN HOSE:

- Take a length of 3/8" or 7/16" inside diameter hose and attach to the valve drain fitting. So water pressure does not blow the hose off, use a hose clamp to secure in place.
- Locate the other end of the hose at a suitable drain point...floor drain, sump, laundry tub, etc. Check and comply with local codes.

IMPORTANT: Use high quality, thick-wall hose that will not easily kink or collapse. The water softener will not work if water cannot exit this hose during regenerations.

- Tie or wire the hose in place at the drain point. Water pressure will cause it to whip during the backwash and fast rinse cycles of regeneration. Also provide an air gap of at least 1-1/2" between the end of the hose and the drain point. An air gap prevents possible siphoning of sewer water, into the softener, if the sewer should “back-up”.

- If raising the drain hose overhead is required to get to the drain point, do not raise higher than 8' above the floor. Elevating the hose may cause a back-pressure that could reduce brine draw during regenerations.

6. CONNECT AND RUN THE BRINE TANK OVERFLOW HOSE (see figure 3):

NOTE: Move the brine tank (2 tank models) into installation location, next to the resin tank.

FIGURE 2

- Attach a length of 3/8" or 7/16" I.D. hose to the drain elbow, installed in step 2, page 7. Use a hose clamp to hold it in place.

- Locate the other end of the hose at the drain point. DO NOT ELEVATE THIS HOSE HIGHER THAN THE ELBOW ON THE BRINE TANK. DO NOT TEE THIS HOSE TO THE VALVE DRAIN HOSE.

NOTE: This drain is for safety only. If the brine tank should over-fill with water, the excess is carried to the drain.

7. ON 2 TANK MODELS, CONNECT BRINE TUBING:

- Route the brine tubing out, through the largest hole in the brine tank sidewall. Connect the tubing to the nozzle housing, as shown in figure 3, using a nut-ferrule. Tighten the nut, by hand only.

FIGURE 3

- Connect the brine tube to the nozzle housing, as shown in figure 3, using a nut-ferrule.
INSTALLATION STEPS, continued

8. INSTALL GROUNDING CLAMPS AND WIRE (IF NEEDED):

► To maintain electrical ground continuity in the house cold water piping, install the included ground clamps as shown. Be sure the pipes are clean, under the clamps, to assure good contact.

NOTE: A 3-valve bypass system maintains ground continuity.

9. FLUSH PIPES, EXPEL AIR FROM SOFTENER, AND TEST YOUR INSTALLATION FOR WATER LEAKS:

CAUTION: To avoid water or air pressure damage to softener inner parts, be sure to do the following steps exactly as listed.

A. Fully open 2 cold, soft water faucets nearby the softener.

B. Place bypass valve(s) in "bypass" position. On a single valve, slide the stem into BYPASS. On a 3-valve system, close the inlet and outlet valves, and open the bypass valve...see page 6.

C. Fully open the house main water pipe shut-off valve. Observe a steady flow from both opened faucets.

D. Place bypass valve(s) in "service", EXACTLY as follows. KEEP SOFT WATER FAUCETS OPEN.

1. SINGLE BYPASS VALVE: SLOWLY, slide the valve stem toward "service", pausing several times to allow the softener to pressurize slowly.

2. 3-VALVE BYPASS: Fully close the bypass valve and open the outlet valve. SLOWLY, open the inlet valve, pausing several times to allow the softener to pressurize slowly.

E. After about 3 minutes, open a HOT water faucet for 1 minute, or until all air is expelled, then close.

F. Close both cold water faucets.

G. Check your plumbing work for leaks and fix right away, if any are found. BE SURE TO OBSERVE PREVIOUS CAUTION NOTES.

H. Turn on the gas or electric supply to the water heater. Light the pilot, if applicable.

10. ADD WATER AND SALT TO THE BRINE TANK:

► Remove the salt storage area cover. Add about 3 gallons of water into the tank. DO NOT ADD INTO THE BRINEWELL.

► Fill the tank with NUGGET, PELLET or coarse SOLAR water softener salt. Do not use rock, block, granulated, and ice cream making salts, or salt with iron removing additives. Also see page 17. Salt storage capacity is 200 lbs or more (varies by model).

*Note: If the softener is installed in a humid basement or other damp area, it is better to fill the tank more often using less salt (see salt bridging in the maintenance section). Eighty to 100 lbs of salt will last for several months, depending on water hardness, family size, and model of softener.

11. CONNECT TO ELECTRICAL POWER:

► The softener works on 24 volt, 60 Hz electric power. The included transformer changes standard 120 volt AC house power to 24 volts. Plug the transformer into a 120 volt outlet only. Be sure the outlet is always "live" so it can not be switched off by mistake.

Fasten the 2 power cable lugs to the 2 screws on the transformer, and tighten the screws. Then, plug the transformer into the electrical outlet.

12. PROGRAM THE TIMER:

► SOLID STATE TIMER...see page 10.

► ELECTRONIC DEMAND TIMER...see pages 11 and 12.
PROGRAMMING THE SOLID STATE TIMER

SEE PAGE 11 FOR ELECTRONIC DEMAND TIMER INSTRUCTIONS.

![North Star® Timer Diagram]

- **TIMER SETTINGS REQUIRED**...upon installation, and after an extended power outage (see Power Outage Memory, page 19).

NOTE: WHEN THE TRANSFORMER IS PLUGGED INTO THE ELECTRICAL OUTLET (STEP 11, PAGE 9), 12:00AM, SUnday begins to flash in the display area. Program the timer as follows.

**SET TIME OF DAY, AND PRESENT DAY OF WEEK**

1. Press button #1, TIME AND DAY. .................. The hour display continues to flash.

2. Press button #4, SET FUNCTIONS/CLEAR until the present hour of the day shows. ................. Be sure AM for morning hours, or PM for afternoon and evening hours shows.

3. Press button #1 to steady the hour display. .... Minutes begin to flash.

4. Press button #4 to set the present minutes.

5. Press button #1 to steady the time. .................. A day of the week begins to flash.

6. Press button #4 until the present day of the week shows.

7. Press button #1 to steady the entire display.

NOTE: The timer has factory set default values that automatically apply when the timer is plugged into electrical power. These values include 3 set regenerations, or recharges, each week (on Mondays, Wednesdays and Saturdays), with a 2:00 AM starting time. This schedule will provide most families with their soft water requirements, and no other timer settings are needed. However, if you want to adjust the softener to the most economical settings for your particular water supply and water usage, please go to page 20 for additional instruction. The special features of your timer are explained on pages 19 and 20.

TO COMPLETE THE INSTALLATION, GO TO THE SANITIZING PROCEDURES ON PAGE 13.
PROGRAMMING THE ELECTRONIC DEMAND TIMER

SEE PAGE 10 FOR SOLID STATE TIMER INSTRUCTIONS.

► TIMER SETTINGS REQUIRED...upon installation, and after an extended power outage (see Program Memory, page 24).

NOTES:
• WHEN THE TRANSFORMER IS PLUGGED INTO THE ELECTRICAL OUTLET (STEP 11, PAGE 9), 12:00AM (flashing), and PRESENT TIME show in the display area. Program the timer as instructed below. If SR - - is flashing, use the UP button to set the correct SR code as follows: SR22 for NSC 25D and NST 25D models; SR31 for NST 30D models; and SR39 for NST 40D models. If you pass by the correct code number, use the DOWN button. Then, press the SELECT button and program the timer below. If the wrong SR code shows for your model, see Manual Initiated Electronic Diagnostics on pages 25 and 26.
• A “beeper” sounds while pressing buttons for timer programming. One beep signals a change in the timer display. Repeated beeps means the timer will not accept a change from the button you have pressed, and you should use another button.
• To set the timer, you will use the UP , DOWN and SELECT buttons.

► SET PRESENT TIME OF DAY

NOTE: If the words PRESENT TIME do not show in the display, press the SELECT button until they do.

1. Press the UP or DOWN button to set. The UP button moves the display ahead; the DOWN moves the time backward. ...................

NOTE: Each press of the buttons changes the time by 1 minute. Holding the buttons in changes the time 32 minutes each second.

2. When the present time shows, press SELECT to set.

If the present time is between noon and midnight, be sure PM shows.

If the present time is between midnight and noon, be sure AM shows.

TIMER SETTINGS CONTINUED, NEXT PAGE
PROGRAMMING THE ELECTRONIC DEMAND TIMER, continued

**SET WATER HARDNESS NUMBER**

NOTE: If 15 (factory default) and HARDNESS do not show in the display, press SELECT until they do.

1. Press the UP or DOWN button to set your water hardness number in the display. DOWN moves the display down to 1, UP moves the display up to 95 (SR22), 110 (SR31), or 120 (SR39). ....................

   NOTE: Each press of a button changes the display by 1 between 1 and 25. Above 25, the display changes 5 at a time ...25, 30, 35, etc. Holding a button in changes the numbers twice each second. See the specified maximum hardness, page 4.

2. When your water hardness number shows, press SELECT to set.

**SET REGENERATION (STARTING) TIME**

NOTE: RECHARGE TIME and a flashing 2:00 AM (factory default) should show in the display. This is a good time for regeneration to start (over in about 2 hours) in most households because water is not in use. HARD WATER is bypassed to house faucets during regeneration. ... See Automatic Bypass on page 15.

If no change is needed, go to step 2 following. To change this time, if desired, do step 1.

1. Press the UP or DOWN button to set the desired regeneration start time. ..............................

   NOTE: Each press of the buttons changes the time by 1 hour. Holding the buttons in changes the time twice each second.

2. Press the SELECT button once more. ..............

   You can get the grains per gallon (ggg) hardness of your water supply from a water analysis laboratory, or call and ask your local water department. If you are on a municipal supply. If water contains iron, add to the water hardness at a ratio of 5 grains for each 1 ppm of iron.

Be sure to observe the AM or PM, as you did when setting the time of day.

The display shows the present time of day and RECHARGE TONIGHT.

The special features of your timer are explained on page 24.

TO COMPLETE THE INSTALLATION, GO TO THE SANITIZING PROCEDURES ON PAGE 13.
SANITIZING PROCEDURES

Care is taken at the factory to keep your water softener clean and sanitary. Materials used to make the softener will not infect or contaminate your water supply, and will not cause bacteria to form or grow. However, during shipping, storage, installing and operating, bacteria could get into the softener. For this reason, sanitizing as follows is suggested when installing.

1. Be sure to complete all installation steps, including timer programming.

2. Pour about 3/4 oz of common 5.25% household bleach (Clorox, Linco, Bo Peep, White Sail, Eagle, etc.) into the brineswell (figure 3, page 8).

3. Use the REGENERATE, OR RECHARGE, NOW feature, on the timer, to start an immediate regeneration. The bleach is drawn into and through the water softener to sanitize it. This sanitizing regeneration is over in about 2 hours. Then, soft water is available for your use.

© NOTE: Sanitizing is recommended by the water Quality Association for disinfecting. On some water supplies, they suggest periodic sanitizing.

NOTE: When the above sanitizing regeneration is over, your house COLD water supply is fully soft immediately. However, your water heater is filled with hard water and, as hot water is used, it will refill with soft water. When all the hard water is replaced, in the water heater, hot only, and mixed hot and cold water will be fully soft. If you want totally soft water immediately, after the above regeneration, drain the water heater until the water runs cold. If you do drain the water heater, use extreme care as the water could cause severe burns.
WATER AND WATER CONDITIONING

WATER ..................................................................................................................

Man's very existence depends on water. It is 1 of the
basic commodities of life. Water is best as nature
provides it, is a common misconception. Practically
all natural water needs refinement or treatment to
make it safe to drink or more satisfactory to use.

The earth's water supply cycle starts in the upper
cloud layers. As it falls to the earth as rain or snow,
it picks up impurities and gases from the atmos-
phere. Landing on earth, it seeps over and through
the ground, dissolving earth minerals. Passing
through limestone, it dissolves calcium and magnes-
ium, the hardness minerals. Iron deposits impart
iron to the water. Acidity and sediments are other
water conditions.

WATER CONDITIONING ............................................................................

Water conditioning is the treatment of 4 general
conditions. These are: Hardness, Iron, Acidity, Sediments.

HARDNESS is a term to describe the presence of
calcium and magnesium minerals in water. A chemi-
cal analysis accurately measures the amount of
minerals in grain weight. For example, 1 gallon
of water with 5 grains per gallon (gpg) hardness has
dissolved minerals, that if solidified, about equals
the size of 1 ordinary aspirin tablet. One gallon of
water, 25 gpg hard, has a mineral content equal in
size to 5 aspirin tablets. Water hardness varies
greatly across the country. It generally contains from
3 to 100 gpg.

Hard water affects living in general. Hardness min-
erals combine with soap to make a soap curd. The
curd greatly reduces the cleaning action of soap.
Precipitated hardness minerals form a crust on
cooking utensils, appliances, and plumbing fixtures.
Even the tastes of foods are affected. A water soft-
enner removes the hardness minerals to eliminate
these problems, and others.

Sodium Information: Water softeners using sodium
chloride (salt) for regeneration add sodium to the
water. Persons on sodium restricted diets should
consider the added sodium as part of their overall in-
take.

IRON in water is measured in parts per million
(ppm). The total* ppm of iron, and type or types*, is
determined by chemical analysis. Four different
types of iron in water are: 1 Ferrous (clear water),
2 Ferric (red water), 3 Bacterial and organically
bound iron, 4 Colloidal and inorganically bound
iron (ferrous or ferric).

*Water may contain 1 or more of the 4 types of iron and
any combination of these. Total iron is the sum of the
contents.

1 Ferrous (clear water) iron is soluble and dissolves
in water. It is usually detected by taking a sample of
water in a clear bottle or glass. Immediately after tak-
ing, the sample is clear. As the water sample stands,
it gradually clouds and turns slightly yellow or brown
as air oxidizes the iron. This usually occurs in 15 to
30 minutes. A water softener will remove moderate
amounts of this type of iron (see specifications).

2 Ferric (red water), and 3 Bacterial and organically
bound iron are insoluble. This iron is visible im-
mEDIATELY when drawn from a faucet because it has
oxidized before reaching the home. It appears as
small cloudy yellow, orange, or reddish suspended
particles. After the water stands for a period of time,
the particles settle to the bottom of the container.
Generally these iron are removed from water by
filtration. Chlorination is also recommended for bac-
terial iron.

4 Colloidal and inorganically bound iron is of ferric
or ferrous form that will not filter or exchange out of
continued
WATER AND WATER CONDITIONING, continued

Water. In some instances, treatment may improve colloidal iron water, but always CONSULT A QUALIFIED WATER CHEMISTRY LAB before attempting to treat it. Colloidal iron water usually has a yellow appearance when drawn. After standing for several hours, the color persists and the iron does not settle, but remains suspended in the water.

Iron in water causes stains on clothing and plumbing fixtures. It negatively affects the taste of food, drinking water, and other beverages.

ACIDITY or acid water is caused by carbon dioxide, hydrogen sulfide, and sometimes industrial wastes. It is corrosive to plumbing, plumbing fixtures, water heaters, and other water using appliances. In can also damage and cause premature failure of seals, diaphragms, etc., in water handling equipment.

A chemical analysis is needed to measure the degree of acidity in water. This is called the pH of water. Water testing below 6.9 pH is acidic. The lower the pH reading, the greater the acidity. A neutralizer filter or a chemical feed pump are usually recommended to treat acid water.

SEDIMENT is fine, foreign material particles suspended in water. This material is most often clay or silt. Extreme amounts of sediment may give the water a cloudy appearance. A sediment filter normally corrects this condition.

HOW THE WATER SOFTENER WORKS

SOFT WATER SERVICE, AND REGENERATION ...see illustrations, page 16

SERVICE

When the softener is providing soft water, it is called "Service". During service, hard water flows from the house main water pipe into the softener. Inside the softener resin tank is a bed made up of thousands of tiny, plastic resin beads. As hard water passes through the bed, each bead attracts and holds the hardness minerals. This is called ion-exchanging. It is much like a magnet attracting and holding metals. Water without the hardness minerals (soft water) flows from the softener and to the house pipes.

After a period of time, the resin beads hold all of the hardness minerals they can and cleaning is needed to remove them. This cleaning is called regeneration, or recharge. The demand timer automatically determines when regenerations occur. The solid state timer is programmed for regeneration days. Regeneration is started at 2:00 a.m. (factory setting) by the softener timer, and consists of 5 stages or cycles. These are: FILL, BRINING, BRINE RINSE, BACKWASH, and FAST RINSE.

REGENERATION

• FILL: Salt, dissolved in water, is called brine. Brine is needed to clean the hardness minerals from the resin beads. To make the brine, water flows into the salt storage area during the fill stage as shown on page 16.

• BRINING: During brining, brine travels from the salt storage area, into the resin tank. Brine is the cleaning agent needed to remove the hardness minerals from the resin beads. The hardness minerals, and brine are discharged to the drain.

The nozzle and venturi create a suction to move the brine, maintaining a very slow rate to get the best resin cleaning with the least salt.

• BRINE RINSE: After a pre-measured amount of brine is used, the brine valve closes. Water continues to flow in the same path as during brining, except for the discontinued brine flow. Hardness minerals and brine flush from the resin tank, to the drain.

• BACKWASH: During backwash, water travels up through the resin tank at a fast flow rate, flushing accumulated iron, dirt, and sediments from the resin bed and to the drain.

• FAST RINSE: Backwash is followed by a fast flow of water down through the resin tank. The fast flow flushes brine from the bottom of the tank, and packs the resin bed.

After fast rinse, the softener returns to soft water service.

AUTOMATIC HARD WATER BYPASS DURING REGENERATION . . . . . . . . . .

For emergency needs, hard water is available to the home during the regeneration cycles. However, you should avoid using HOT water because the water heater will refill with the hard water.

GENERAL WATER SOFTENER MAINTENANCE

CHECKING THE SALT STORAGE LEVEL, AND REFILLING

Brine (salt dissolved in water) is needed for each and every regeneration. The water for making brine is metered into the salt storage area by the softener valve and timer. However, you must keep the tank full of salt.

WHEN TO REFILL WITH SALT: Check the salt level a few weeks after you install the softener and every week after that. Refill when the brine tank is from 1/3 to 1/2 full. Never allow the softener to use all the salt before you refill it. Without salt, you will soon have hard water.

Use clean water softener salts only, at least 99.5% pure. NUGGET, PELLET or coarse SOLAR salts are recommended. Do not use rock, block, granulated, and ice cream making salts. They contain dirt and sediments, or mush and cake, and will create maintenance problems.

NOTE: WATER SOFTENING SALT WITH IRON

REMOVING ADDITIVES: Some salts have an additive to help the softener handle iron in the water supply. Although this additive may help to keep the softener resin clean, it may also release corrosive fumes that weaken and shorten the life of some softener parts.

BREAKING A SALT BRIDGE

Sometimes, a hard crust or salt bridge forms in the salt storage area. It is usually caused by high humidity or the wrong kind of salt. When the salt bridges, an empty space forms between the water and salt. Then salt will not dissolve in the water to make brine.

If the brine tank is full of salt, it is hard to tell if you have a salt bridge. Salt is loose on top, but the bridge is under it. The following is the best way to check for a salt bridge.

Salt should be loose all the way to the bottom of the tank. Take a broom handle, or like tool, and carefully push it down into the salt, working it up and down. If the tool strikes a hard object (be sure it's not the bottom or sides of the tank), it's most likely a salt bridge. Carefully break the bridge with the tool. DO NOT pound on the walls of the tank.

If the wrong kind of salt made the bridge, take it out. Then fill the tank with nugget or pellet salt only. In humid areas, it is best to fill with less salt, more often.

CLEANING IRON OUT OF THE WATER SOFTENER

Your water softener takes hardness minerals (calcium and magnesium) out of the water. Also, it can control some (see specifications, page 4) "clear water" iron. With clear water iron, water from a faucet is clear when first put into a glass. After 15 to 30 minutes, the water begins to cloud or turn rust colored. A water softener WILL NOT remove any iron that makes the water cloudy or rusty as it comes from the faucet (called red water iron). To take red water iron out of water, or over the maximum of clear water iron, an iron filter or other equipment is needed. Your local dealer has trained people to help you with iron water problems.

If your water supply has clear water iron, periodic resin bed cleaning is needed. Clean the bed at least every 6 months, or more often if iron appears in the soft water between treatments. Follow directions on the resin bed cleaner container.
GENERAL WATER SOFTENER MAINTENANCE, continued

CLEANING THE NOZZLE AND VENTURI ASSEMBLY

A clean nozzle and venturi is needed for the softener to work right. This small unit makes the suction to move brine from the salt storage area to the resin tank during regeneration. If it becomes plugged with sand, silt, dirt, etc., the softener will not work and you will get hard water.

To get to the nozzle and venturi, remove the softener top cover. Be sure the softener is in service cycle (no water pressure at nozzle and venturi). Then, while holding the nozzle & venturi housing with 1 hand, turn off the cap. Lift out the screen support and screen, then the nozzle and venturi. Wash and rinse the parts in warm water until clean. If needed, use a small brush to remove iron or dirt. Also check and clean the gasket.

NOTE: Some models have a small flow plug located in the nozzle and venturi, and/or a small cone shaped screen in the housing. Be sure to check and clean these parts, if your model is so equipped.

Carefully replace all parts in the correct order. Lubricate the o-ring seal with silicone grease and place in position. Install and tighten the cap, BY HAND ONLY. DO NOT OVER-TIGHTEN AND BREAK THE CAP OR HOUSING.

SERVICE CHECKLIST

NO SOFT WATER

No salt in storage tank: See page 17 to refill, then start a regeneration, or recharge.
Transformer unplugged at wall outlet, or power cable disconnected: Reconnect to electrical power and start a regeneration, or recharge.
Fuse blown, circuit breaker popped, or circuit mistakenly switched off: Check and resolve as needed. Then, start a regeneration, or recharge.
Plumbing bypass valve(s) in “bypass” position: Refer to page 6 and position valve(s) as needed to direct soft water to house pipes. Then, start a regeneration, or recharge.
Timer not programmed, or in “Vacation” : See.... Solid State Timer – page 10.
Electronic Demand Timer – page 11.
Nozzle & venturi dirty, or salt in storage tank bridged: See page 17, and above to clean. Then, start a regeneration, or recharge.

WATER INTERMITTENTLY HARD

Too few regenerations programmed (Solid State only): See pages 20 and 21.
Using more water since timer was programmed (Solid State only): See pages 20 and 21.
Possible increase in water hardness: See.... Solid State Timer – page 20 and 21.
Electronic Demand Timer – page 12.
Hot water used when softener is regenerating: The water heater will refill with hard water... see Automatic Hard Water Bypass During Regenerations, page 15.
Leaking faucet or toilet valve: A small leak will waste hundreds of gallons of water in just a few days. Fix all water leaks immediately.
SOLID STATE TIMER FEATURES, SETTINGS, AND SERVICE

NOTE: SEE PAGE 10 TO SET THE TIMER FOR THE CORRECT TIME, AND TO THE DAY OF THE WEEK.

NORMAL OPERATION, TIMER DISPLAYS

During normal operation, the present time of day, and AM or PM, show in the time display area. When a regeneration begins, RCHG starts to flash in the display, along with the present time. RCHG flashes until the regeneration is over.

feature: REGENERATE NOW CONTROL

If you have used, or plan to use, more water than usual (house guests, extra washing, etc.), you could run out of soft water before the next scheduled regeneration occurs. To be assured this will not happen, use the "regenerate now" control. Press button #5 and hold in until RCHG begins to flash in the time display. A regeneration begins immediately, and it will last for about 2 hours. When over, you will have a full supply of soft water.

NOTE: Avoid using HOT water during the regeneration, because the water heater will refill with hard water.

feature: VACATION CONTROL

Before going on vacation, or other long absence, touch (do not hold in) button #5 so VAC starts to flash in the display. The timer continues to keep time, but regenerations will not occur to waste water and salt.

When you return, touch button #5 again to return the softener to service, and the present time in the display. REMEMBER TO DO THIS, or the softener will not regenerate, and you will soon have hard water.

feature: POWER OUTAGE MEMORY

If electrical power to the timer is interrupted, the "memory" built into timer circuitry keeps all settings for 6 hours (minimum) or more. The display is blank and the softener will not regenerate. When electrical power comes on, 1 of 2 things will happen.

1. The present time of day will show, meaning the timer memory has kept all settings.

NOTE: If the softener was in a regeneration when power was lost, it will now finish the cycle.

2. The display will show a time, but it will be flashing. The timer memory did not keep the time settings and they must be reset (page 10). The flashing display returns to a time of 12:00 AM Sunday, then begins to keep time again. If you do not reset all time settings, the softener will regenerate 3 days each week. However, regeneration will most likely be on the wrong days and at the wrong time.

NOTE: The flashing display is to remind you to reset the timer.

If the softener was in a regeneration when power was lost, the valve will return to service position without finishing the regeneration cycle. If your water tastes salty...

...use REGENERATE NOW (see above) to start another regeneration, or...

...open 1 or more soft water faucets and allow to run until the salt taste is gone.

continued
feature: DOUBLE BACKWASH

During the backwash cycle of regeneration, a fast upward flow of water flushes dirt, sediments, iron deposits, etc., to the drain to help keep the resin bed clean (see page 15). On some water supplies, a second backwash may help to remove these elements. To set a second backwash, which occurs between the fill and brining cycles, do the following:

1. Press button #4 and hold in to turn on the entire display, including 18:88.

2. Press button #1 to display 3 dashes.

3. Press button #4 to display dbl.

4. Press button #1 to display 18:88.

5. Press button #4 to return the present time display.

feature: ERROR CODES

An error code could appear in the faceplate display if a problem occurs in the softener electronics. If you see an error code, for example E - 3, instead of the present time of day, please call your local dealer for service, or see your warranty on page 2.

<table>
<thead>
<tr>
<th>CODE</th>
<th>MOST LIKELY</th>
<th>POSSIBLE DEFECT</th>
<th>LESS LIKELY</th>
</tr>
</thead>
<tbody>
<tr>
<td>E - 1, E - 2, E - 3, E - 4</td>
<td>wiring harness or connection to switch / switch / motor inoperative / valve defect causing high torque</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

TO REMOVE AN ERROR CODE: (1) unplug transformer (2) correct defect (3) plug transformer in (4) Wait for at least 6 minutes. The error code will return if the reason for the error code was not corrected.

setting: REGENERATION (STARTING) TIME, AND/OR REGENERATION DAYS

NOTE: The timer has factory set default values that automatically apply when the timer is plugged into electrical power. These values include 3 set regenerations, or recharges, each week (on Mondays, Wednesdays and Saturdays), with a 2:00 AM starting time. This schedule will provide most families with their soft water requirements, and no other timer settings are needed. However, if you want to adjust the softener to the most economical settings for your particular water supply and water usage, please continue below. Use the table on page 21 as a guide for setting days of regeneration.

1. Press button #2 REGENERATION TIME, and the currently set regeneration starting time flashes. To change the regeneration start time, do step 2. Otherwise, go to step 3.

2. Press button #4 SET FUNCTIONS/CLEAR, until the desired regeneration starting hour shows. Press Button #1 to return the present time, or continue below to change the days of regeneration.

3. Press button #3 REGENERATION DAY, and Sun day begins to flash.

... If you do not want Sunday regenerations, press button #4 until OFF shows.

4. Press button #3 again and MONday flashes. As you did in step 3, use button #4 to set ON or OFF, as indicated in the table.

5. Press button #3 to display a flashing TUesday, Wednesday, etc., each time using button #4 to set ON or OFF, as the table shows.

6. After regeneration is either set or cancelled for Saturdays, press button #1 to return the present time and day display.
setting: **FILL CYCLE MINUTES** *(determines salt usage for each regeneration) .....*

NOTE: The table of suggested regeneration settings, below, also shows the fill minutes to set.

1. Press and **hold** in button #2 until **FILL** shows in the display. In a few seconds, the currently set fill cycle minutes flash. (The factory set default is 8 min.)

2. Press button #4 and set the needed minutes of fill, as the table shows.

3. Press button #1 to return the present time and day display.

**setting: TABLE OF SUGGESTED REGENERATION SETTINGS .................**

**HOW TO USE THE TABLE**

1. Locate your model in the left hand column. You will use this model section of the table only.
2. Locate the number of persons in your household, in the next column of your model section.
3. Locate the grains per gallon (gpg) hardness of the water supply, across the top of the table, in your model section.
4. Read across and down the table to find the intersecting point of steps 2 and 3.
5. At this intersecting point are the suggested days to regenerate the softener (M = Monday, T = Tuesday, etc.), and the minutes of FILL cycle to set...above.

**EXAMPLE:** NST25SS INSTALLED, 4 PEOPLE IN THE HOUSEHOLD, 24 GPG WATER HARDNESS: You would set the timer to regenerate 3 days each week (Mondays, Wednesdays and Saturdays suggested), using a 4 minute fill cycle time. The dotted lines in the table represent this example.

<table>
<thead>
<tr>
<th>NSC or NST MODEL</th>

solute: **REGENERATION CYCLE TIME ADJUSTMENTS** ........................................

The brining (80 min.), backwash (12 min.), and fast rinse (4 min.) cycles of regeneration are factory set for maximum performance of the softener. Changing these times is not recommended. Use the following procedures to check for correct cycle times.

**NOTE:** Removing from electrical power (varies from 6 to 15 hours) resets timer to factory programming.

**DISPLAY MUST SHOW TIME AND DAY**

1. Press and hold button #4... the entire display comes on.

2. Press button #2...2:08 shows, meaning no. 2 cycle (brining & brine rinse) and 80 minutes (8 x 10).
   - a. If 2:08 does show, go to step 3.
   - b. If other than 2:08 (2:00 to 2:15) shows, press button #4 until 2:08 shows.

3. Press button #2...3:12 shows, meaning no. 3 cycle (backwash) and 12 minutes.
   - a. If 3:12 does show, go to step 4.
   - b. If other than 3:12 shows (3:00 to 3:30), press button #4 until 3:12 shows.

**service: TIMER / SOFTENER, SERVICE CHECKOUT PROCEDURE** .................

If you are not getting soft water, use the procedures below to find the problem. First, make the following visual checks.

**VISUAL CHECKS:** (1) Is there electrical power to the outlet the softener transformer is plugged into?

(2) Is there salt in the storage tank? (3) Is the plumbing bypass valve(s) directing water for soft water service... see page 6? (4) Is the valve drain hose open to the drain, not elevated too high, and unobstructed? If you do not find a problem with the visual checks, continue below.

---

**NO SOFT WATER**

- Timer shows wrong time and day, and/or is flashing
  - Timer display blank
  - Timer display shows correct time and day, and is steady

- Electrical power was off. Reset all timer programming.

- Investigate reason for power loss. Be sure outlet for softener cannot be switched off.

- No power
  - Repair as needed
  - Timer defective

- Power okay
  - Do manual advance diagnostic to verify proper function.
service: **MANUAL ADVANCE DIAGNOSTIC**

Use the following procedures to advance the softener valve through regeneration cycles to check operation.

Remove top cover to observe valve rotation.

**DISPLAY MUST SHOW TIME AND DAY**

1. Press and hold button #4 for 3 seconds until 18:88 displays.

2. Press button #3 to display the position (P) switch open or closed indicator.

If valve is in service, fill, brining, backwash or fast rinse (see markings on cam under motor), the display will show...(- -), meaning the position switch is open.

While the valve is rotating from 1 cycle to another, the display will show (- P), meaning the position switch is closed.

3. To advance valve, press button #5 each time you want to move into the next cycle. (Pressing #5 while valve is rotating has no affect.)

   ➤ Press and hold button #5 for 3 seconds to move softener into fill cycle. Remove brinewell cover and, using a flashlight, observe fill water entering the brine tank.

   a. If it does not move into fill, valve motor is inoperative. Check all wiring and connections.

   b. If water does not enter tank...
      ... obstructed nozzle and venturi assembly
      ... obstructed brine tubing or brine valve

   ➤ After fill, press button #5 to move softener into brining. A slow flow of water to drain begins. Verify brine draw from brine tank (use flashlight to observe brine level dropping in brinewell).

   c. If softener does not draw brine...
      ... dirty or defective nozzle and venturi assembly, or incorrectly assembled
      ... obstructed drain hose, or elevated too high
      ... obstruction in brine tubing or brine valve
      ... defective disc seal, rotor, wave washer, or other inner valve failure

**NOTE:** Be sure a salt bridge is not preventing water with salt contact.—

   ➤ Again press button #5 to move softener into backwash. Look for a fast flow of water from drain hose.

   d. Obstructed flow indicates a plugged top distributor, backwash flow plug, or drain hose.—

   ➤ Press button #5 to move softener into fast rinse. Again look for fast drain flow. Allow softener to rinse for a few minutes to flush out any brine remaining in resin tank from the brining cycle test.

   ➤ To return softener to service, press button #5.

4. Press button #3 to display 18:88.

5. Press button #4 to return present time and day.

**WIRING SCHEMATIC**

---

**NOTE:** WHILE IN MANUAL ADVANCE, THE TIME DISPLAY WILL AUTOMATICALLY RETURN TO THE PRESENT TIME IF A BUTTON IS NOT PRESSED WITHIN 4 MINUTES.
ELECTRONIC DEMAND TIMER FEATURES, AND SERVICE

NOTE: SEE PAGE 11 TO SET THE TIMER TO THE CORRECT TIME OF DAY, WATER HARDNESS NUMBER, AND RECHARGE START TIME.

NORMAL OPERATION, TIMER DISPLAYS

During normal operation, the present time of day, and AM or PM, show in the time display area. When the demand computer determines a regeneration is needed, RECHARGE TONIGHT begins to flash in the display, along with the present time. RECHARGE TONIGHT flashes until the next regeneration start time, then changes to RECHARGE NOW, which flashes until the regeneration is over.

feature: OPTIONAL RECHARGE CONTROLS

Sometimes, a manually started regeneration (recharge) may be desired, or needed. Two examples are:

... You have used more water than usual (house guests, extra washing, etc.) and you may run out of soft water before the next regeneration.

... You did not refill the storage tank with salt before it was all gone.

Use 1 of the following features to start a regeneration immediately, or at the next preset regeneration start time.

RECHARGE NOW

Press and hold in the TOUCH - HOLD button until RECHARGE NOW starts to flash in the time display area. The softener begins an immediate regeneration, and when over in about 2 hours, you will have a new supply of soft water. Once started, you cannot cancel this regeneration.

RECHARGE TONIGHT

Touch (do not hold) the TOUCH - HOLD button, and RECHARGE TONIGHT flashes in the time display area. A regeneration will occur at the next preset regeneration start time. If you decide to cancel this regeneration, touch the same button once more.

VACATION NOTE

North Star Demand water softeners regenerate only while water is used and softening capacity must be restored. For this reason, the softener will not regenerate when you are away from home for extended periods.

feature: PROGRAM MEMORY

If electrical power to the softener is interrupted, the time display is blank, but the timer keeps correct time for about 6 hours. When power is restored, you have to reset the present time only if the display is flashing. All other settings are maintained and never require resetting unless a change is desired.

If the time is flashing after a long power outage, the softener continues to work as it should to provide you with soft water. However, regenerations may occur at the wrong time of day until you reset the timer to the correct time of day, page 11.

feature / service: AUTOMATIC ELECTRONIC DIAGNOSTICS

The timer computer has a self-diagnostic function for the electrical system (except input power and water meter). The computer monitors the electronic components and circuits for correct operation. If a malfunction occurs, an error code appears in the timer display.

The following chart (page 25) shows the error codes that could appear, and possible defects for each code. While an error code is displayed, all timer buttons are inoperative except for the SELECT button. SELECT remains operational so the service person can make the Manual Initiated Electronic Diagnostics to further isolate the defect, and check the water meter.
service: **TIMER / SOFTENER, SERVICE CHECKOUT PROCEDURE**

If you are not getting soft water, and an error code is not displayed, use the procedures below to find the problem. First, make the following visual checks.

**VISUAL CHECKS:**
1. Is there electrical power to the outlet the softener transformer is plugged into?
2. Is there salt in the storage tank?
3. Is the plumbing bypass valve(s) directing water for soft water service?
4. Is the valve drain hose open to the drain, not elevated too high, and unobstructed? If you do not find a problem with the visual checks, continue below.

---

**NO SOFT WATER**

1. **TIMER SHOWS WRONG TIME AND DAY, AND/OR IS FLASHING**
   - Investigate reason for power loss. Be sure outlet for softener cannot be switched off.
2. **TIMER DISPLAY BLANK**
   - Check electrical power to timer (outlet, transformer, power cable, all connections).
   - Do manual diagnostics.
3. **TIMER DISPLAY SHOWS CORRECT TIME AND DAY, AND IS STEADY**
   - Electrical power was off. Reset the correct time of day.

---

**SERVICE: MANUAL INITIATED ELECTRONICS DIAGNOSTIC**

1. To enter diagnostics, press and hold the SELECT button until (000 - -) shows in the display.

   ![Diagram of turbine switch and water meter connections]

   (A) The first 3 digits indicate water meter operation as follows:
   - 000 (steady) = soft water not in use...no flow through the meter.
   - 000 to 199 (continual) = repeats display for each gallon of water passing through the meter.

   **OPEN A NEARBY SOFT WATER FAUCET**

   - continued
If you don’t get a reading in the display, with faucet open, pull the sensor from the valve outlet port. Pass a small magnet back and forth in front of the sensor. You should get a reading in the display. If you get a reading, unhook the in and out plumbing and check the turbine for binding.

(B) The letter (P) and dash(es) indicate POSITION switch operation. The letter appearing means the switch is closed; the dash means the switch is open. Use the TOUCH - HOLD (Recharge Tonight – Now) button to manually advance the valve into each cycle and check correct switch operation.

<table>
<thead>
<tr>
<th>CORRECT SWITCH DISPLAYS</th>

<td>Valve in service, fill, brining, backwash or fast rinse position.</td>
</tr>
<tr>
<td>- P</td>
<td>Valve rotating from one position to another.</td>
</tr>
</tbody>
</table>

C. While in this diagnostic screen, the following information is available and may be beneficial for various reasons. This information is retained by the computer from the first time electrical power is applied to the face plate.

...Press the UP △ button to display the number of days this face plate has had electrical power applied.

...Press the DOWN ▼ button to display the number of regenerations initiated by this face plate since the SR code number was entered.

2. Press the SELECT button and hold in 3 seconds until a Service Rating code appears in the display.

For correct softener operation, the SR number must match the model as follows.

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>SR22</td>
<td>NST 25ED, NSC 25ED</td>
</tr>
<tr>
<td>SR31</td>
<td>NST 30ED</td>
</tr>
<tr>
<td>SR39</td>
<td>NST 40ED</td>
</tr>
</tbody>
</table>

To reset the code, press the UP or DOWN button until the correct number shows.

3. Press SELECT to return the present time display. If the code was changed, make ALL the timer settings, pages 11 and 12.

service: MANUAL ADVANCE REGENERATION CHECK

This check verifies proper operation of the valve motor, brine tank fill, brine draw, regeneration flow rates, and other controller functions. First, make the initial checks, and the manual initiated diagnostics.

NOTE: The face plate display must show a steady time (not flashing).

1. Press the TOUCH - HOLD button and hold in for 3 seconds. RECHARGE NOW begins to flash as the softener enters the fill cycle of regeneration. Remove the brinewell cover and, using a flashlight, observe fill water entering the brine tank.

If water does not enter the tank, look for an obstructed nozzle, venturi, fill flow plug, brine tubing, or brine valve riser pipe.

2. After observing fill, press the TOUCH - HOLD button to move the softener into brining. A slow flow of water to the drain will begin. Verify brine draw from
the brine tank by shining a flashlight into the brine-well and observing a noticeable drop in the liquid level.

**NOTE:** Be sure a salt bridge is not preventing water with salt contact.

- If the softener does not draw brine...
- nozzle and/or venturi dirty or defective.
- nozzle and venturi not seated properly on gasket.
- restricted drain (check drain fitting and hose).
- defective nozzle and venturi seal.
- other inner valve defect (rotor seal, rotor & disc, wave washer, etc.).

**NOTE:** If water system pressure is low, an elevated drain hose may cause back pressure, stopping brine draw.

3. Again, press the TOUCH - HOLD button to move the softener into backwash. Look for a fast flow of water from the drain hose.

- A slow flow indicates a plugged top distributor, backwash flow plug, or drain hose.

4. Press TOUCH - HOLD to move the softener into fast rinse. Again look for a fast drain flow. Allow the softener to rinse for a few minutes to flush out any brine that may remain in the resin tank from the brining cycle test.

5. To return the softener to service, press TOUCH - HOLD.

- Bottom distributor
- To Valve Outlet (soft water)
- From Valve Inlet (hard water)

BRINING and BRINE RINSE CYCLES
- Bypass hard water
to valve outlet
- Venturi
- Drain
- Nozzle
- Brine from salt storage tank
- Soft water
to valve outlet
- From Valve Inlet (hard water)
- Drain
- From Valve Inlet (hard water)

BACKWASH CYCLE
- Flow plug
- Drain
- From Valve Inlet (hard water,}

FAST RINSE CYCLE
- Drain
- From Valve Inlet (hard water)

CYCLE TIMES - MINUTES

PARTS RETURN TAGS

If you have a defective part or assembly under warranty, please fill in a parts return tag. Cut out the tag and include it with the defective part when you return it to the place where you purchased the conditioner. To avoid destroying the repair parts information on the reverse side of this page, make a photo copy of the return tags to use.
